Received October 2014; Revised October 2014; Accepted January 2015

Abstract — In this paper, we have formulated the problem of non-response in multivariate stratified sample surveys as a Multi-Objective Geometric Programming problem (MOGPP). The fuzzy programming approach has described for solving the formulated MOGPP. The formulated MOGPP has been solved and the solution is obtained. The obtained solution is the dual solution corresponding to the multi-objective multivariate stratified sample surveys in presence of non-response. Afterward with the help of dual solution of formulated MOGPP and primal-dual relationship theorem the optimum allocation of sample sizes of respondents and non-respondents are obtained. A numerical example is given to illustrate the procedure.

Keywords — geometric programming, fuzzy programming, multi-objective optimization, non-response, optimum allocation, multivariate stratified sampling

1. INTRODUCTION

In stratified sampling heterogeneous population is converted into a homogeneous population by dividing it into homogeneous stratum. The maximum precision will be obtained with the best choices of the sample sizes. The problem of optimum allocation in stratified random sampling for univariate population is well known in sampling literature; see for example Cochran (1977) and Sukhatme et al. (1984). In multivariate stratified sample survey the problem of non-response can appear when the required data are not obtained. The problem of non-response may occur due to the refusal by respondents or they are not at home making the information of sample inaccessible. The problem of non-response occurs in almost all surveys. The extent of non-response depends on various factors such as type of the target population, type of the survey and the time of survey. For dealing the problem of non-response the population is divided into two disjoint groups of respondents and non-respondents. For the stratified sampling it may be assumed that every stratum is divided into two mutually exclusive and exhaustive groups of respondents and non-respondents.

Hansen and Hurwitz (1946) presented a classical non-response theory which was first developed for the survey in which the first attempt was made by mailing the questionnaires and a second attempt was made by personal interview to a sub sample of the non respondents. They constructed the estimator for the population mean and derived the expression for its variance and also worked out the optimum sampling fraction among the non respondents. El-Badry (1956) further extended the Hansen and Hurwitz’s technique by sending waves of questionnaires to the non respondent units to increase the response rate. The generalized El-Badry’s approach for different sampling design was given by Foradari (1961). Srinath (1971) suggested the selection of sub samples by making several attempts. Khare (1987) investigated the problem of optimum allocation in stratified sampling in presence of non-response for fixed cost as well as for fixed precision of the estimate. Khan et al. (2008) suggested a technique for the problem of determining the optimum allocation and the optimum sizes of subsamples to various strata in multivariate stratified sampling in presence of non-response which is formulated as a nonlinear programming problem (NLPP). Varshney et al. (2011) formulated the multivariate stratified random sampling in the presence of non-response as a multi-objective integer nonlinear programming problem and a solution procedure is developed using lexicographic goal programming technique to determine the compromise allocation. Fatima and Ahsan (2011) address the problem of optimum allocation in stratified sampling in the presence of non-response.

Raghav et al. (2014) have discussed the various multi-objective optimization techniques in the multivariate stratified sample surveys in case of non-response.

Geometric programming (GP) is a smooth, systematic and an effective non-linear programming method used for solving problems of sample surveys and engineering design that takes the form of convex programming. The convex
programming problems occurring in GP are generally represented by an exponential or power function. GP has certain advantages over the other optimization methods because it is usually much simpler to work with the dual than the primal one. The degree of difficulty (DD) plays a significant role for solving a non-linear programming problem by GP method. Geometric Programming (GP) has been known as an optimization tool for solving the problems in various fields. Duffin, Peterson and Zener (1967) and also Zener (1971) have discussed the basic concepts and theories of GP with application in engineering in their books. Beightler, C.S., and Phillips, D.T., also published a famous book on GP and its application in (1976). Engineering design problems was also solved by Shiang (2008) and Shaojian et al. (2008) with the help of GP. Davis and Rudolph (1987) applied GP to optimal allocation of integrated samples in quality control.

Ahmed and Charles (1987) applied geometric programming to obtain the optimum allocations in multivariate double sampling. Maqbool et al. (2011), Shafiullah et al. (2013) have discussed the geometric programming approach for obtaining the optimum allocations in multivariate two-stage and three-stage sample surveys respectively. In many real-world decision-making problems of sample surveys, environmental, social, economical and technical areas are of multiple-objectives problems. Multi-objective optimization problems differ from single-objective optimization. It is significant to realize that multiple objectives are often non-commensurable and in conflict with each other in optimization problems. The fuzzy goal is defined as the objective which can be obtained within exact target value. The multi-objective models with fuzzy objectives are more realistic than deterministic of it. The concept of fuzzy set theory was firstly given by Zadeh (1965). Later on, Bellman and Zadeh (1970) used the fuzzy set theory to the decision-making problem. Tanaka (1974) introduces the objective as fuzzy goal over the α-cut of a fuzzy constraint set and Zimmermann (1978) gave the concept to solve multi-objective linear-programming problem. Biswal (1992) and Verma (1990) developed fuzzy geometric programming technique to solve multi-objective geometric programming (MOGP) problem. Islam (2005, 2010) has discussed modified geometric programming problem and its applications and also another fuzzy geometric programming technique to solve MOGPP and their applications. Fuzzy mathematical programming has been applied to several fields.

In this paper, we have formulated the problem of non-response in multivariate stratified sample surveys as a multi-objective geometric programming problem (MOGPP). The fuzzy geometric programming approach has described for solving the formulated MOGPP and optimum allocation of sample sizes of respondents and non respondents are obtained. A numerical example is given to illustrate the procedure.

2. FORMULATION OF THE PROBLEM

In stratified sampling the population of \( N \) units is first divided into \( L \) non-overlapping subpopulation called strata, of sizes \( N_1, N_2, ..., N_h, ..., N_L \) with \( \sum_{h=1}^{L} N_h = N \) and the respective sample sizes within strata are denoted by

\[ n_1, n_2, ..., n_h, ..., n_L \] with \( \sum_{h=1}^{L} n_h = n. \]

Let for the \( h^{th} \) stratum:

\[ N_h : \text{stratum size.} \]
\[ \bar{Y}_h : \text{stratum mean.} \]
\[ S^2_h : \text{stratum variance.} \]
\[ W_h = \frac{N_h}{N} : \text{stratum weight.} \]
\[ N_{h1} : \text{be the sizes of the respondents.} \]
\[ N_{h2} = N_h - N_{h1} : \text{be the sizes of non respondents groups.} \]
\[ n_h : \text{Units are drawn from the \( h^{th} \) stratum. Further let out of \( n_h , \ n_{h1} \) units belong to the respondents group.} \]
\[ n_{h2} = n_h - n_{h1} : \text{Units belong to the non respondents group.} \]
\[ n = \sum_{h=1}^{L} n_h : \text{The total sample size.} \]

A more careful second attempt is made to obtain information on a random subsample of size \( r_h \) out of \( n_{h2} \) non respondents for the representation from the non respondents group of the sample.

\[ r_h = \frac{n_{h2}}{k_h} : h = 1, 2, ..., L \] : Subsamples of sizes at the second attempt to be drawn from \( n_{h2} \) non–respondent group of the \( h^{th} \) stratum. Where \( k_h \geq 1 \) and \( \frac{1}{k_h} \) denote the sampling fraction among non respondents.
Since \( N_{h1} \) and \( N_{h2} \) are random variables hence their unbiased estimates are given as
\[
\hat{N}_{h1} = \frac{n_{h1} N_{h1}}{n_h} : \text{Unbiased estimate of the respondents group.}
\]
\[
\hat{N}_{h2} = \frac{n_{h2} N_{h2}}{n_h} : \text{Unbiased estimate of the non respondents group.}
\]
\[
\bar{y}_{j,1} ; j = 1, \ldots, p : \text{denote the sample means of } j^{th} \text{ characteristic measured on the } n_{h1} \text{ respondents at the first attempt.}
\]
\[
\bar{y}_{j,2(\alpha)} ; j = 1, \ldots, p : \text{denote the } r_h \text{ sub sampled units from non respondents at the second attempt.}
\]

Using the estimator of Hansen and Hurwitz (1946), the stratum mean \( \bar{y}_{jh} \) for \( j^{th} \) characteristic in the \( h^{th} \) stratum may be estimated by
\[
\bar{y}_{jh(u)} = \frac{n_{h1} \bar{y}_{j1} + n_{h2} \bar{y}_{j2(\alpha)}}{n_h}
\]
(1)

It can be seen that \( \bar{y}_{jh(u)} \) is an unbiased estimate of the stratum mean \( \bar{y}_{jh} \) of the \( h^{th} \) stratum for the \( j^{th} \) characteristic with a variance,
\[
V(\bar{y}_{jh(u)}) = \left( \frac{1}{n_h} - \frac{1}{N_h} \right) S_{jh}^2 + \frac{W_{h2}^2 S_{jh2}^2}{r_h} - \frac{W_{h2}^2 S_{jh2}^2}{n_h}
\]
(2)
where \( S_{jh}^2 \) is the stratum variance of \( j^{th} \) characteristic in the \( h^{th} \) stratum; \( j = 1,2,\ldots, p, h = 1,2,\ldots,L \) given as:
\[
S_{jh}^2 = \frac{1}{N_h - 1} \sum_{i=1}^{N_h} (y_{jh} - \bar{y}_{jh})^2
\]
where \( y_{jh} \) denote the value of the \( i^{th} \) unit of the \( h^{th} \) stratum for \( j^{th} \) characteristic. \( \bar{y}_{jh} = \frac{1}{N_h} \sum_{i=1}^{N_h} y_{jh} \) : is the stratum mean of \( y_{jh} \). \( S_{jh2}^2 \) is the stratum variance of the \( j^{th} \) characteristic in the \( h^{th} \) stratum among non respondents, given by:
\[
S_{jh2}^2 = \frac{1}{N_{h2} - 1} \sum_{i=1}^{N_{h2}} (y_{jh} - \bar{y}_{jh2})^2
\]
\[
\bar{y}_{jh2} = \frac{1}{N_{h2}} \sum_{i=1}^{N_{h2}} y_{jh} \text{ is the stratum mean of } y_{jh} \text{ among non respondents. } W_{h2} = \frac{N_{h2}}{N_h} \text{ is stratum weight of non respondents in } h^{th} \text{ stratum.}
\]

If the true values of \( S_{jh}^2 \) and \( S_{jh2}^2 \) are not known they can be estimated through a preliminary sample or the value of some previous occasion, if available, may be used. Furthermore, the variance of \( \bar{y}_{j(u)} = \sum_{h=1}^{L} W_h \bar{y}_{jh(u)} \) (ignoring fpc) is given as:
\[
V(\bar{y}_{j(u)}) = \sum_{h=1}^{L} W_h^2 V(\bar{y}_{jh(u)}) = \sum_{h=1}^{L} W_h^2 \left( \frac{S_{jh}^2}{n_h} - \frac{W_{h2}^2 S_{jh2}^2}{r_h} \right) + \frac{L W_{h2}^2 S_{jh2}^2}{r_h}
\]
(3)
where \( \bar{y}_{j(u)} \) is an unbiased estimate of the overall population mean \( \bar{y}_j \) of the \( j^{th} \) characteristic and \( V(\bar{y}_{jh(u)}) \) is as given in Eqn.2.

Assuming a linear cost function the total cost \( C \) of the sample survey may be given as:
\[
C = \sum_{h=1}^{L} c_{h0} n_h + \sum_{h=1}^{L} c_{h1} n_{h1} + \sum_{h=1}^{L} c_{h2} n_{h2}
\]
where \( c_{h0} = \) the per unit cost of making the first attempt, \( c_{h1} = \sum_{j=1}^{p} c_{jh1} \) is the per unit cost for processing the results of all the \( p \) characteristics on the \( n_{h1} \) selected units from respondents group in the \( h^{th} \) stratum in the first attempt and \( c_{h2} = \sum_{j=1}^{p} c_{jh2} \) is the per unit cost for measuring and processing the results of all the \( p \) characteristics on the \( r_h \) units selected from the non respondents group in the \( h^{th} \) stratum in the second attempt. Also, \( c_{jh1} \) and \( c_{jh2} \) are per unit costs of measuring the \( j^{th} \) characteristic in first and second attempts respectively. As \( n_{h1} \) is not known until the first attempt has been made, the quantity \( W_{h1} n_{h1} \) may be used as its expected value. The total expected cost \( \hat{C} \) of the survey may be given as:

1813-713X Copyright © 2015 ORSTW
where \( q \) is the total number of functions in the constraint.

The dual form of standard Primal MOGPP which is stated in (7) can be given as:

\[
\begin{align*}
\hat{f}_n (r) &= \frac{\prod_{h=1}^{S} n_{h}^{\rho_{h}^{l,h}}} {\prod_{h=1}^{S} n_{h}^{\rho_{h}^{l,h}}} , j = 1, 2, \ldots, p \\
\end{align*}
\]

where \( C_h = (c_{30} + c_{31}W_{31}) \), \( C_h' = c_{62} \).

If \( q = 1 \), let the function \( \psi_{qh} \) be define as, \( \psi_{qh} = W_{h}^{2}(S_{h}^{2} - W_{h}^{2}S_{h}^{2}) \), and if \( q = 2 \), then \( \psi_{2h} = W_{h}^{2}W_{h}^{2}S_{h}^{2} \), where \( q \) is the number of functions in objective function. The above expression (6) can be expressed in the standard Primal GPP as follows:

\[
\begin{align*}
\text{Max} & \quad f_0 (n, r), \quad j = 1, 2, \ldots, p \\
\text{Subject} & \quad f (n, r) \leq 1 \\
& \quad n_{h} , n_{h} \geq 0 , \quad h = 1, 2, \ldots, L
\end{align*}
\]

where \( f_0 (n, r) = \sum_{h=1}^{S} \psi_{1h} n_{h} + \sum_{h=1}^{S} \psi_{2h} r_{h}, \) \( j = 1, 2, \ldots, p \) and \( f_0 (n, r) = \sum_{h=1}^{S} C_{h} n_{h} + \sum_{h=1}^{S} C_{h} r_{h} \) are in the form of posynomial functions, where the posynomial function is given as:

\[
\begin{align*}
f (n, r) &= \sum_{h=1}^{S} \xi_{qh} [\prod_{k=1}^{n_{h}^{\rho_{h}^{l,h}}} n_{h}^{\rho_{h}^{l,h}}] + \sum_{h=1}^{S} \xi_{qh} [\prod_{k=1}^{n_{h}^{\rho_{h}^{l,h}}} r_{h}^{\rho_{h}^{l,h}}], \quad \xi_{qh} \geq 0, \quad n_{h} , r_{h} \geq 0, \quad q = 1, 2 \quad (8)
\end{align*}
\]

where \( \xi_{qh} \) are normalized constants. If \( q = 1 \), let the function \( \xi_{qh} \) be define as, \( \xi_{1h} = \frac{C_h}{C_0} \) and if \( q = 2 \), then \( \xi_{2h} = \frac{C_h}{C_0} \), where \( q \) is the total number of functions in the constraint.

If \( q \) be the number of terms in the problem. Then the number of posynomial terms in objective function \( f_0 (n, r) \) can be denoted by \( qh \). For the above problem of sample surveys, \( q = 2 \) as \( n_{h} \) and \( r_{h} \) are two different variables corresponding to the \( h^{th} \) strata. Therefore, the total number of posynomial terms for the discussed problem will be \( 2h \) and \( h = 1, 2, \ldots, L. \)

Similarly, the total number of posynomial terms corresponding to the primal constraint are denoted by \( 2h \) as \( n_{h} \) and \( r_{h} \) are two different variables and the exponents \( \rho_{h}^{l,h} \) and \( \rho_{h}^{r,h} \) are real constants corresponding to the objective functions and constraints functions respectively.

The dual form of standard Primal MOGPP which is stated in (7) can be given as:
The above formulated MOGPP (9) can be solved in the following two-steps:

Step 1: For the Optimum value of the objective function, the objective function always takes the form:

\[
\text{Max } v_{ij}(w_{ih}^*) = \prod_{l=1}^{L} \left( \frac{\psi_{il}}{w_{il}} \right)^{w_{il}} \prod_{l=1}^{L} \left( \frac{\xi_{ih}}{w_{ih}} \right)^{w_{ih}} \left( \sum_{i=1}^{L} \sum_{l=1}^{L} w_{il} \right)^{\sum_{i=1}^{L} \sum_{l=1}^{L} w_{il}}
\]

where \( w_{ih}^* \) is the ideal solutions of the objective functions

\[
\text{Subject } \sum_{i=1}^{L} \sum_{h=1}^{L} w_{ih} = 1 \quad (i)
\]

\[
\sum_{i=1}^{L} \sum_{h=1}^{L} p_{ih} w_{ih} + \sum_{i=1}^{L} \sum_{h=1}^{L} p_{ih} w_{ih} = 0 \quad (ii)
\]

\[
w_{ih} \geq 0, w_{ih} \geq 0, i = q \text{ and } h = 1,\ldots,L
\]

The Multi-Objective objective function for our problem is:

\[
\prod_{i=1}^{L} \left( \frac{\psi_{il}}{w_{il}} \right)^{w_{il}} \prod_{i=1}^{L} \left( \frac{\xi_{ih}}{w_{ih}} \right)^{w_{ih}} \left( \sum_{i=1}^{L} \sum_{l=1}^{L} w_{il} \right)^{\sum_{i=1}^{L} \sum_{l=1}^{L} w_{il}}
\]

(10)

The equations that can be used for MOGPP for the weights are given below:

\[
\sum_{i=1}^{L} \sum_{h=1}^{L} w_{ih} \text{ for each term in objective function } \times (\text{exponent on } n_h \text{ and } r_i \text{ in objective function})
\]

\[
\sum_{i=1}^{L} \sum_{h=1}^{L} w_{ih} \text{ for each term in constraints function } \times (\text{exponent on } n_h \text{ and } r_i \text{ in constraints function}) = 0
\]

(Orthogonality condition, see 9(iii))

Step 2: The solutions procedure to solve the problem (6) consists of the following steps:

Step 1: From the results of step 1, determine the corresponding values for every objective at each solution derived. With the

values of all objectives at each ideal solution, payoff matrix can be formulated as follows:

\[
\begin{vmatrix}
(n^{(1)}, r^{(1)}) & (n^{(2)}, r^{(1)}) & \cdots & (n^{(1)}, r^{(p)}) & \cdots & (n^{(p)}, r^{(1)}) & \cdots & (n^{(p)}, r^{(p)})
\end{vmatrix}
\]

Here \((n^{(1)}, r^{(1)}), (n^{(2)}, r^{(1)}), \ldots, (n^{(1)}, r^{(i)}), \ldots, (n^{(p)}, r^{(p)})\) are the ideal solutions of the objective functions

1813-713X Copyright © 2015 ORSTW
Step 3: The membership function for the given problem can be defined as:

$$
\mu_j(f_{ij}(n,r)) = \begin{cases} 
0, & \text{if } f_{ij}(n,r) \geq U_j \\
\frac{U_j(n,r) - f_{ij}(n,r)}{U_j(n,r) - L_j(n,r)}, & \text{if } L_j \leq f_{ij}(n,r) \leq U_j, \; j = 1, 2, \ldots, p \\
1, & \text{if } f_{ij}(n,r) \leq L_j
\end{cases}
$$

(11)

Figure 1: Membership function for minimization variance problem

The membership functions in Eqn. (11) i.e., $\mu_j(f_{ij}(n,r))$, $j = 1, 2, \cdots, p$. Therefore the general aggregation function can be defined as $\mu_\alpha(n,r) = \mu_\alpha(f_{i1}(n,r)), \mu_\alpha(f_{i2}(n,r)), \ldots, \mu_\alpha(f_{ip}(n,r))$.

The fuzzy multi-objective formulation of the problem can be defined as:

$$
\text{Max } \mu_\alpha(n,r) \\
\text{Subject to } \sum_{k=1}^{l} C_1n_k + \sum_{k=1}^{l} C_2r_k \leq 1; \; \text{and } n_k, r_k \text{ are integers, } \alpha = 0, 1 \ldots \; (12)
$$

The problem to find the optimal values of $(n^*, r^*)$ for this there are two types of fuzzy decision operators and they

(i) Fuzzy decision based on max-min operator (like Zimmermann’s approach (1978)). Therefore the problem (12) is reduced to the following problems according to max-min operator

$$
\text{Max } \alpha \\
\text{Subject to } \mu_j(f_{ij}(n,r)) \geq \alpha \\
\sum_{k=1}^{l} C_1n_k + \sum_{k=1}^{l} C_2r_k \leq 1; \; \text{and } n_k, r_k \text{ are integers, } \alpha \leq 1 \ldots \; (13)
$$

(ii) Convex-fuzzy decision based on addition operator (like Tewari et al. (1987)). Therefore the problem (12) is reduced according to max-addition operator as...
The above problem (14) reduces to

\[
\text{Min} \sum_{j=1}^{p} \left( \frac{f_{0j}(n,r)}{U_j - L_j} \right)
\]

Subject to

\[
f_{j}(n,r) = \sum_{h=1}^{H} C_h n_h + \sum_{h=1}^{H} C_2 r_h \leq 1;
\]

\[
n_h, r_h \geq 0 \quad \text{and} \quad n_h, r_h \text{ are integers, } j=1,2,\ldots, p.
\]  

The problem (15) maximizes if the function \[\frac{f_{0j}(n,r)}{U_j - L_j}\] attain the minimum values. Therefore the problem (15) reduce into the problem (16) define as

\[
\text{Min} \sum_{j=1}^{p} \left( \frac{f_{0j}(n,r)}{U_j - L_j} \right)
\]

Subject to

\[
f_{j}(n,r) = \sum_{h=1}^{H} C_h n_h + \sum_{h=1}^{H} C_2 r_h \leq 1;
\]

\[
n_h, r_h \geq 0 \quad \text{and} \quad n_h, r_h \text{ are integers, } j=1,2,\ldots, p.
\]  

The problem (16) has been solved with the help of steps (1-2) discuss in section (3) and the corresponding solutions \(w^*_i\) is the unique solution to the dual constraints, it will also maximize the objective function for the dual problem. Next, the solution of the primal problem will be obtained using primal-dual relationship theorem which is given below:

Primal-dual relationship theorem: If \(w^*_i\) is a maximizing point for dual problem (9), each minimizing points \((n_1, n_2, n_3, n_4)\) and \(r_1, r_2, r_3, r_4\) for primal problem (6) satisfies the system of equations:

\[
f_{0j}(n,r) = \left\{ \begin{array}{ll}
w^*_i \in J[0], & i \in J[1] \\
w^*_i \in J[L], & i \in J[L]
\end{array} \right.
\]

where \(L\) ranges over all positive integers for which \(v_i^*(w^*_i) > 0\). The optimal values of respondents \(n_h^*\) and non-respondents \(r_h^*\) can be calculated with the help of the primal – dual relationship theorem (17).

5. NUMERICAL ILLUSTRATION

A numerical example is given to demonstrate the proposed method. The values of \(S_{h}^2\) and \(S_{h}^2\) are practically unknown. Their values on some previous occasion may be used. It is assumed that the relative values of the stratum variances among the non-respondents at the second attempt to the corresponding over all stratum variances are \(S_{h}^2\) \(S_{h}^2\) = 0.25 \(h = 1, 2,\ldots, L\) and \(j = 1,2,\ldots, p\). This ratio has been taken as 0.25 in the example for the sake of simplicity.

Practically this ratio may vary from stratum to stratum and from characteristic to characteristic. Consider a population of size \(N = 3850\) divided into four strata. The two characteristics are defined on each unit of the population and the population means are to be estimated. The available information is shown in the given table.
For solving MOGPP by using fuzzy programming, we shall first solve the two sub-problems:

**Sub problem 1:** On substituting the table values in sub problem 1, we have obtained the expressions given below:

$$\text{Min } f_{01} = \frac{456.3344}{n_1} + \frac{261.8965}{n_2} + \frac{209.5529}{n_3} + \frac{230.9097}{n_4} + \frac{11.10002688}{r_1} + \frac{2.75680566}{r_2} + \frac{3.492547875}{r_3} + \frac{4.866484}{r_4}$$

Subject to

$$0.00048n_1 + 0.00068n_2 + 0.0008n_3 + 0.00092n_4 + 0.0006r_1 + 0.0008r_2 + 0.001r_3 + 0.0012r_4 \leq 1$$

$$n_h \geq 0, \ r_h \geq 0; \ (h = 1, 2, \ldots, L) \quad (18)$$

The dual of the above problem (18) is obtained as:

$$\text{max } v(w_{i0}) = \left(456.3344 / w_{01}\right)\times\left(261.8965 / w_{02}\right)\times\left(209.5529 / w_{03}\right)\times\left(230.9097 / w_{04}\right)\times\left(11.10002688 / w_{01}\right)\times\left(2.75680566 / w_{02}\right)\times\left(3.492547875 / w_{03}\right)\times\left(4.866484 / w_{04}\right)$$

$$\times\left(w_{11}\right)\times\left(w_{10}\right)\times\left(w_{14}\right)\times\left(w_{15}\right)\times\left(w_{16}\right)\times\left(w_{17}\right)\times\left(w_{18}\right)$$

$$((w_{11} + w_{12} + w_{13} + w_{14} + w_{15} + w_{16} + w_{17} + w_{18})^{w_{10}}(w_{11} + w_{12} + w_{13} + w_{14} + w_{15} + w_{16} + w_{17} + w_{18}));$$

Subject to

$$w_{01} + w_{02} + w_{03} + w_{04} + w_{05} + w_{06} + w_{07} + w_{08} = 1; \ \text{(normality condition)}$$

$$w_{01} + w_{11} = 0$$

$$w_{02} + w_{12} = 0;$$

$$w_{03} + w_{13} = 0;$$

$$w_{04} + w_{14} = 0;$$

$$w_{05} + w_{15} = 0;$$

$$w_{06} + w_{16} = 0;$$

$$w_{07} + w_{17} = 0;$$

$$w_{08} + w_{18} = 0;$$

$$w_{01}, w_{02}, w_{03}, w_{04}, w_{05}, w_{06}, w_{07}, w_{08} \geq 0;$$

$$w_{11}, w_{12}, w_{13}, w_{14}, w_{15}, w_{16}, w_{17}, w_{18} \geq 0 \quad (19)$$

For solving MOGPP by using fuzzy programming, we shall first solve the two sub-problems:

**Sub problem 1:** On substituting the table values in sub problem 1, we have obtained the expressions given below:
The optimal values and the objective function value are given below:

\begin{align*}
    n_1^* &= 482, \
    n_2^* &= 307, \
    n_3^* &= 253, \
    n_4^* &= 247.
\end{align*}

The optimal values and the objective function value are given below:

\begin{align*}
    n_1^* &= 482, \
    n_2^* &= 307, \
    n_3^* &= 253, \
    n_4^* &= 247; \
    r_1^* &= 67, \
    r_2^* &= 29, \
    r_3^* &= 29, \
    r_4^* &= 31
\end{align*}
and the objective value of the primal problem is 4.098514.

**Sub problem1**: On substituting the table values in sub-problem 2, we have obtained the expressions given below:

\[
\text{Min } f_{w2} = \frac{769.2353}{n_1} + \frac{318.9684}{n_2} + \frac{99.53584}{n_3} + \frac{259.5712}{n_4} + \frac{187111296}{r_1} + \frac{335756232}{r_2} + \frac{1658930625}{r_3} + \frac{547053248}{r_4}; \\
\text{Subject to} \\
0.00048n_1 + 0.00068n_2 + 0.00092n_3 + 0.00092n_4 + 0.00008r_1 + 0.0008r_2 + 0.0010r_3 + 0.0012r_4 \leq 1 \\
n_h \geq 0, \quad r_h \geq 0; \quad (h=1,2,\ldots,L)
\]

The dual of the above problem (20) is obtained as follows:

\[
\text{Max } v(w_{i2}) = \left(\frac{769.2353}{w_{i1}}\right)^{v_w} \times \left(\frac{318.9684}{w_{i2}}\right)^{v_w} \times \left(\frac{99.53584}{w_{i3}}\right)^{v_w} \times \left(\frac{259.5712}{w_{i4}}\right)^{v_w} \times \left(\frac{187111296}{w_{i5}}\right)^{v_w} \\
\times \left(\frac{335756232}{w_{i6}}\right)^{v_w} \times \left(\frac{1658930625}{w_{i7}}\right)^{v_w} \times \left(\frac{547053248}{w_{i8}}\right)^{v_w} \times \left(\frac{0.00048}{w_{i9}}\right)^{v_w} \times \left(\frac{0.00068}{w_{i10}}\right)^{v_w} \times \left(\frac{0.00008}{w_{i11}}\right)^{v_w} \times \left(\frac{0.00092}{w_{i12}}\right)^{v_w} \times \left(\frac{0.00092}{w_{i13}}\right)^{v_w} \times \left(\frac{0.00008}{w_{i14}}\right)^{v_w} \times \left(0.00008 \right)^{v_w} \\
\times (w_{i1} + w_{i2} + w_{i3} + w_{i4} + w_{i5} + w_{i6} + w_{i7} + w_{i8})^{v_w} \\
\times (w_{i1} + w_{i2} + w_{i13} + w_{i14} + w_{i15} + w_{i16} + w_{i17} + w_{i18}); \quad (i)
\]

Subject to \( w_{i1} + w_{i2} + w_{i3} + w_{i4} + w_{i5} + w_{i6} + w_{i7} + w_{i8} = 1 \); (normality condition) \( (ii) \)

\[-w_{i1} + w_{i1} = 0 \\
-w_{i2} + w_{i2} = 0; \\
-w_{i3} + w_{i3} = 0; \\
-w_{i4} + w_{i4} = 0; \\
-w_{i5} + w_{i5} = 0; \\
-w_{i6} + w_{i6} = 0; \\
-w_{i7} + w_{i7} = 0; \\
-w_{i8} + w_{i8} = 0; \\
w_{i1}, w_{i2}, w_{i3}, w_{i4}, w_{i5}, w_{i6}, w_{i7}, w_{i8} > 0; \quad (\text{orthogonality condition}) \quad (iii)
\]

\[
\begin{align*}
& w_{i1}, w_{i2}, w_{i3}, w_{i4}, w_{i5}, w_{i6}, w_{i7}, w_{i8} > 0; \\
& w_{i1}, w_{i2}, w_{i3}, w_{i4}, w_{i5}, w_{i6}, w_{i7}, w_{i8} \geq 0; \quad (\text{positivity condition}) \quad (iv)
\end{align*}
\]

For orthogonality condition defined in expression 21(iii) are evaluated with the help of the payoff matrix which is defined below:
Solving the above formulated dual problems, we have the corresponding solution as:

\[
\left(\begin{array}{cccccccccc}
-1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & -1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & -1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & -1 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & -1 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & -1 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & -1 & 0 & 0 & 0 \\
\end{array}\right)
\]

\[
\left(\begin{array}{cccc}
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
0 & 0 & 0 & 1 \\
0 & 0 & 0 & 0 \\
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
\end{array}\right)
\]

\[
= \left(\begin{array}{cccc}
-w_{01} + w_{11} = 0 \\
-w_{02} + w_{12} = 0 \\
-w_{03} + w_{13} = 0 \\
-w_{04} + w_{14} = 0 \\
-w_{05} + w_{15} = 0 \\
-w_{06} + w_{16} = 0 \\
-w_{07} + w_{17} = 0 \\
-w_{08} + w_{18} = 0 \\
\end{array}\right)
\]

The optimal values \((n^*_1, r^*_1, n^*_2, r^*_2, n^*_3, r^*_3, n^*_4, r^*_4)\) of the sample sizes of the primal problems can be calculated with the help of the primal – dual relationship theorem (17) as we have calculated in the sub-problem 1are given as follows:

\[
n^*_1 = 596, n^*_2 = 322, n^*_3 = 166 \text{ and } n^*_4 = 250;
\]

\[
r^*_1 = 83, r^*_2 = 30, r^*_3 = 19 \text{ and } r^*_4 = 32
\]

and the objective value of the primal problem is 4.510388.

Now the pay-off matrix of the above problems is given below:

\[
\begin{pmatrix}
(n^{(1)}, r^{(1)}) & f_{01}(n, r) \\
(n^{(2)}, r^{(2)}) & f_{02}(n, r)
\end{pmatrix}
\]

\[
= \begin{pmatrix}
4.098446 & 4.703153 \\
4.323975 & 4.510388
\end{pmatrix}
\]

The lower and upper bond of \(f_{01}(n, r)\) and \(f_{02}(n, r)\) can be obtained from the pay-off matrix

\[
4.098446 \leq f_{01}(n, r) \leq 4.323975 \text{ and } 4.510388 \leq f_{02}(n, r) \leq 4.703153.
\]

Let \(\mu_1(n, r)\) and \(\mu_2(n, r)\) be the fuzzy membership function of the objective function \(f_{01}(n, r)\) and \(f_{02}(n, r)\) respectively and they are defined as:

\[
\mu_1(n, r) = \begin{cases} 
1 & \text{if } f_{01}(n, r) \leq 4.098446 \\
4.323975 - \frac{f_{01}(n, r)}{0.225529} & \text{if } 4.098446 \leq f_{01}(n, r) \leq 4.323975 \\
0 & \text{if } f_{01}(n, r) \geq 4.323975
\end{cases}
\]

\[
\mu_2(n, r) = \begin{cases} 
1 & \text{if } f_{02}(n, r) \leq 4.098446 \\
4.323975 - \frac{f_{02}(n, r)}{0.225529} & \text{if } 4.098446 \leq f_{02}(n, r) \leq 4.323975 \\
0 & \text{if } f_{02}(n, r) \geq 4.323975
\end{cases}
\]

Figure 2: The figure illustrate the graph of the fuzzy membership function \(\mu_1(n, r)\).
Figure 2: The figure illustrate the graph of the fuzzy membership function \( \mu_z(n,r) \)

\[
\mu_z(n,r) = \begin{cases} 
1 & \text{if } Z_z(n,r) \leq 4.510450 \\
\frac{4.703153 - Z_z(n,r)}{0.192703} & \text{if } 4.510450 \leq Z_z(n,r) \leq 4.703153 \\
0 & \text{if } Z_z(n,r) \geq 4.703153 
\end{cases}
\]

On applying the max-addition operator, the MOGPP, the standard primal problem reduces to the crisp problem as:

\[
\begin{align*}
\text{Maximize} & \quad (\mu_1(n,r) + \mu_2(n,r)) \\
\text{i.e Maximize} & \quad \left\{\frac{4.323975 - f_{o1}(n,r)}{0.225529} + \frac{4.703153 - f_{o2}(n,r)}{0.192703}\right\} \\
\text{Subject to} & \quad \sum_{h=1}^{L} n_h + 3.4 n_2 + 4 n_3 + 4.6 n_4 + 3 r_1 + 4 r_2 + 5 r_3 + 6 r_4 \leq 5000 \\
& \quad n_h \geq 0, \quad r_h \geq 0, \quad h = 1, 2, \ldots, L
\end{align*}
\]

In order to maximize the above problem, we have to minimize \( f_{o1}(n,r) + f_{o2}(n,r) \), subject to the constraints as described below:

\[
\begin{align*}
\text{Min} & \quad \left\{\frac{6015.1794}{n_1} + \frac{2816.4718}{n_2} + \frac{1445.6789}{n_3} + \frac{2370.8464}{n_4}ight\} \\
& \quad \left\{\frac{146.3152}{r_1} + \frac{29.6471}{r_2} + \frac{24.0947}{r_3} + \frac{49.9662}{r_4}\right\} \\
\text{Subject to} & \quad \sum_{h=1}^{L} n_h + 0.00068 n_2 + 0.0008 n_3 + 0.00092 n_4 + 0.0006 n_1 + 0.0008 r_2 + 0.001 r_3 + 0.0012 r_4 \leq 1 \\
& \quad n_h \geq 0, \quad r_h \geq 0, \quad h = 1, 2, \ldots, L
\end{align*}
\]

Degree of Difficulty of the problem (23) is \( = (16-8+1) = 7 \). Hence the dual problem of the above final formulated problem (23) is given as:
After solving the formulated dual problem (24) using lingo software we obtain the following values of the dual variables which are given as:

\[ \begin{array}{ccccccccc}
0.068 & 0.080 & 0.092 & 0.00068 & 0.0008 & 0.00092 & 0.00006 & 0.00008 & 0.0001 & 0.00012 \\
11 & 12 & 13 & 14 & 15 & 16 & 17 & 18 & 19 & 20
\end{array} \]

Subject to

\[ \begin{align*}
& w_{01} + w_{02} + w_{03} + w_{04} + w_{05} + w_{06} + w_{07} = 1; \quad \text{(normality condition)} \\
& w_{01} + w_{02} + w_{03} + w_{04} + w_{05} + w_{06} + w_{07} + w_{08} = 1; \quad \text{(orthogonality condition)}
\end{align*} \]

(24)

For orthogonality condition defined in expression 24(iii) are evaluated with the help of the payoff matrix which is defined below:

\[
\begin{bmatrix}
-1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & -1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & -1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & -1 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & -1 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & -1 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & -1 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & -1 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & -1 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & -1
\end{bmatrix}
\]

\[
\begin{bmatrix}
w_{01} \\
w_{02} \\
w_{03} \\
w_{04} \\
w_{05} \\
w_{06} \\
w_{07} \\
w_{08} \\
w_{09} \\
w_{10}
\end{bmatrix}
\]

After solving the formulated dual problem (24) using lingo software we obtain the following values of the dual variables which are given as:

\[
\begin{align*}
w_{01} &= 0.2619838, \\
w_{02} &= 0.2133740, \\
w_{03} &= 0.1658174, \\
w_{04} &= 0.2277096, \\
w_{05} &= 0.04568250, \\
w_{06} &= 0.02374487, \\
w_{07} &= 0.02393363, \\
w_{08} &= 0.03775414, \\
w_{09}^* &= 42.06568.
\end{align*}
\]

The optimal values \((n_0^*, n_1^*)\) of the sample sizes of the primal – dual relationship theorem (17) as we have calculated in the sub-problem I are given as follows:

1813-713X Copyright © 2015 ORSTW
and the objective value of the primal problem is 42.06568.

6. CONCLUSION

This paper provides a profound study of fuzzy programming for solving the multi-objective geometric programming problem (MOGPP). The problem of non-response in multivariate stratified sample survey has been formulated as MOGPP and solution obtained. The obtained solution of MOGPP is dual solution corresponding to the problem of non-response in multivariate stratified sample surveys (primal problem). Therefore next, we obtained the optimum allocation of sample sizes of respondents and non-respondents with the help of dual solutions MOGPP and primal-dual relationship theorem. To ascertain the practical utility of the proposed method in sample surveys problem in presence of non-response a numerical example is also given to illustrate the procedure.

Remark: The authors are grateful to the Editor – in - Chief and to the learned referees for their highly constructive suggestions that brings the earlier manuscript in the present form.

REFERENCES
